### ABSTRACT

This work presents catalogues of Forbush Decreasess (FDs) between the periods of 1957 – 1967. Forbush Decrease is a short-time decrease in the intensity of galactic cosmic rays. Such decreases are traced to solar wind disturbances. This work aims to study the catalogues of FDs. To achieve this aim, two approaches will be adopted namely; (1) downloading and presenting the IZMIRAN FDs from their website (2) applying the automated methods of FD identification developed by Okike and Umahi (2019) to identify and present FDs. The IZMIRAN catalog which applied the global survey method, identified a total of 450 FDs while the automated generated FDs (FD1 and FD2) which applied Fourier transformation, identified 500 and 458 FDs respectively. A close study on the three catalogues, pinpointed some differences and similarities. These were attributed to the differences in their methods of identification.

### Keywords:

Cosmic rays,  
Galactic cosmic rays,  
Forbush Decrease,  
Catalogue.

### INTRODUCTION

Forbush decrease (FD) is a short-term reduction in the Galactic cosmic ray (GCR) flux (Okike *et al*, 2021). This reduction in GCR flux was traced to the pioneering work of Scott Forbush (Forbush, 1937). However, FD as a striking cosmic ray time variation is characterized by its profile (Musalem-Ramirez *et al*, 2013). Within a period of few hours, the intensity recorded at a particular CR station can be reduced from 5% up to 20 or 30% in most uttermost instances (Musalem-Ramirez *et al*, 2013). Upon reaching a minimum, the intensity starts to recover slowly. This recovery may last from days to weeks. Contrary to diurnal variation, an FD can be simultaneous which in such cases, the FD is recorded almost the same time all over the world (Musalem-Ramirez *et al*, 2013).

The definition and method of FD identification have been viewed in different ways by cosmic ray (CR) research groups (Belov, 2008; Okike and Umahi, 2019b; Okike, 2020b). While some focus on the magnitude of FD (Lockwood, 1990; Tinsey and Dean, 1991; Ananth and Venkatesan, 1993; Oh ET AL, 2009, 2013; Dumbovic ET AL, 2011), others channel their attention on its interim distribution (Badrudin and Singh, 2006; Verma ET AL, 2014). GCRs can be recorded on the Earth by Neutron Monitors (NMs). Outside NM, several researchers have compiled different datasets to study GCRs and the associated FDs (Papaioannou *et al*, 2019). For instance, (i) the anticoincidence guard data

on Interplanetary Monitoring Platform (IMP) 8 (Cane, 2000; Richardson and Cane, 2011), (ii) the anticoincidence shield (ACS) of the International Gamma-Ray Astrophysics Laboratory (INTEGRAL) spectrometer (SPI), (Jordan *et al*, 2009, 2011), (iii) the measurements of the Electron Proton Helium Instrument (EPHIN) detector onboard the Solar and Heliospheric Observatory and Chandra (Heber *et al*, 2015) and (iv) Cassini's Magnetosphere Imaging Instrument (MIMI)/Low Energy Magnetospheric Measurement System (LEMMS) measurements (Roussos *et al*, 2017). These varying views of FD definition and identification have led to inconsistencies as a continuous challenge in FD identification (Okike ET AL, 2021). Following the relation of FDs to preceding solar emissions, Belov ET AL, (2008) reported that the Forbush Effect and Interplanetary Disturbances database (FEID) maintained by IZMIRAN contains FDs identified without reference to interplanetary (IP) conditions (Okike ET AL, 2021). Claims equally had it that small CR flux reductions in the 0.5-1.0 % range may be regarded as FDs if significant solar wind disturbances are recorded concurrently (Okike ET AL, 2021). It is noted that the IZMIRAN CR group applies the global survey method (GSM) for the selection of FDs in FEID (Okike *et al*, 2021). The GSM records a continuous series of hourly characteristics of variation of the density and vector anisotropy of CR with the rigidity of 10 GV (Okike ET AL, 2021). The group has created comprehensive FD

catalogues using data from the worldwide network of NMIs from 1957 July to the present (e.g. Belov ET AL, 2018a, b).

In contribution to this challenge of FD identification, Okike and Umahi (2019b) and Okike (2020b) developed an algorithm for detection of FDs. This algorithm normalizes raw and Fourier transformed CR data using appropriate filters (Okike and Umahi, 2019b; Okike, 2020). For the FDs identified in the raw data, the impact of diurnal anisotropy was not removed. In addition, FDs can be identified using a careful adjustment for diurnal anisotropy (Okike, 2020).

In furtherance, numerous researchers have presented a great number of FD catalogues. For instance, Okike (2020) presented a large FD catalog using FTS on CR data from Apatity (APTY), Sanae (SNAE), Moscow (MOSC), Oulu (OULU), Magadan (MGDN), Potchefstroom, (PTFM) and South Pole (SOPP), McMurdo (MCMD) and Inuvick (INVK) stations for the year 2003. Papaioannou *et al.*, 2019 compiled a catalog of 424 FDs at Mars using RAD dose rate data, from 2012 to 2016. Okike *et al.*, (2021) compared the Forbush decreases identified from individual and a network of neutron monitors and suggested that while there are significant disparities between the IZMIRAN FD and other event lists, there is a beautiful agreement between FDs they identified in and those in the FEID. In this paper, we will carefully present a catalog of FDs from the IZMIRAN database and those developed by Okike CR research group for the period of the 1957 – 1967.

## MATERIALS AND METHODS

### Data Description

The downloaded and processed/filtered data presented in the tables in this article are generated from IZMIRAN website (<http://spaceweather.izmiran.ru/eng/dbs.html>) for IZMIRAN FDs and the raw CR data equally generated from <http://cr0.izmiran.ru/common> for Moscow (MOSC) station for processed/filtered FDs. The IZMIRAN FDs are configured in hourly average while the raw data for the CR stations are of daily averages and presented at the IZMIRAN website using the American Standard Code for Information Interchange (ASCII) format. The data format for each of the raw CR data from the stations are the same (YYYY.mm.dd HH:MM, followed by the CR count). The complete automated FD event detection developed by Okike and Umahi (2019b) was used to generate FD1 and FD2. The method applies Fourier transformation (FT) on CR data which may be of hourly or daily resolutions. The algorithms are capable of analyzing FDs using hourly or daily data from any arbitrary station.

## RESULTS AND DISCUSSION

### Catalogues of Forbush Decreases downloaded from IZMIRAN website

The catalogues of FDs downloaded from IZMIRAN website are displayed in Tables 1a – d. The FDs are of hourly resolutions. They are selected using the Global Survey Method (GSM)

**Catalogues of Forbush Decreases (FD2) Identified from Fourier Transformed Signal**

The catalogues of FDs (FD2) are presented in Tables 3a - d. These FDs were identified by Fourier Transformed signal (FTS).

### Discussions

#### *IZMIRAN FD Catalogue*

The IZMIRAN FD list is the FD catalogue of the Russian investigators (Belov ET AL, 2018a) which was downloaded from <http://spaceweather.izmiran.ru/eng/dbs.html>. The FDs were generated using the global survey method. It is the most comprehensive and up-to-date Forbush event catalogue. Several CR investigators have employed the catalogue. Some of the publications based on the IZMIRAN FD list are displayed at <http://spaceweather.izmiran.ru/eng/papers.html>. Belov (2008) asserts that the list is more accurate, as it was selected using several CR physical characteristics (e.g. density and anisotropy). The results of this work indicated that IZMIRAN recorded a total of 450 FDs, for the period under study, while a total of 500 and 450 FDs were recorded for FD1 and FD2 respectively which were generated using Fourier transformed algorithm on raw CR data. The disparity in the number of recorded FDs is traced to the differences in data type, resolution, and program efficiency which are some of the factors that may account for the large number of differences in the two catalogues (Okike ET AL, 2021). While assimilated CR data are needed for effective comparison of the efficiency of the two techniques, the number of FDs detected using hourly averages should be larger than those identified using daily averaged CR data (Lockwood 1971).

#### *Automated Generated FD Catalogue*

Table 2a – d shows FDs (FD1) Selected from Raw CR Data. They are considered raw in the sense that neither the contribution from CR anisotropy nor the solar cycle is disentangled. A total of 500 FDs FDs were identified for the period under study. Generally, some FDs were identified to have large magnitudes, for instance, the events of 30/03/1958 and 05/09/1959 recorded large magnitudes of -13.02% and -12.06% respectively. On the other side, some FDs equally recorded small magnitudes, for example, the events of 18/07/1958 and 14/02/1961 recorded small magnitudes of -0.08% and -0.12% respectively.

Table 3a – d shows FDs (FD2) identified from FTS. Here, the contribution from anisotropy is removed but the influence of 11-year solar cycles is not removed. A total number of 458 FDs were identified in this catalogue. Generally, FD2 were observed to have smaller magnitudes when compared to FD1. However, an overall study of the catalogue indicated few FDs with large magnitudes above -5%. For instance, the events of 15/02/1959 and 24/09/1966 recorded large magnitudes of -5.29% and -5.05% respectively. On the other side, the greater number of FDs recorded smaller magnitudes, for instance, the events of 20/12/1965, 29/11/1958 and 18/07/1958 recorded small magnitudes of -0.04%, -0.06% and -0.08% respectively.

Generally, similarities and differences were identified when these two catalogues (FD1 and FD2) were compared with the IZMIRAN FD catalogue. For instance, contrary to the IZMIRAN catalogue, the FD1 catalogue recorded no FD for the year 1957. The first FD in this catalogue was recorded on 18/01/1958. On the side of similarity, the event of 17/01/1958 in IZMIRAN catalogue is the same as that of 18/01/1958 in FD1. The magnitudes of this event for IZMIRAN and FD1 are respectively -3.1 and -2.4%. However, it is clear from the Table that the differences between the two catalogues are significant.

### CONCLUSION

This work concludes that the differences and similarities between large numbers of FDs obtained from the year 1957 - 1967 can be studied by presenting their catalogues.
